Question 1

Correct

Bubble Sort is the simplest [sorting](#) algorithm that works by repeatedly swapping the adjacent elements if they are in wrong order. You read an [list](#) of numbers. You need to arrange the elements in ascending order and print the result. The [sorting](#) should be done using bubble sort.

Input Format: The first line reads the number of elements in the array. The second line reads the array elements one by one.

Output Format: The output should be a sorted [list](#).

For example:

| Input | Result |
|------------------|-------------|
| 6 3 4 8 7 1 2 | 1 2 3 4 7 8 |
| 5 4 5 2 3 1 | 1 2 3 4 5 |

Answer: (penalty regime: 0 %)

```

1 n = int(input())
2 arr = list(map(int, input().split()))
3 for i in range(n):
4     for j in range(0, n-i-1):
5         if arr[j] > arr[j+1]:
6             arr[j], arr[j+1] = arr[j+1], arr[j]
7 print(*arr)

```

| | Input | Expected | Got | |

Question **2**

Correct

An [list](#) contains N numbers and you want to determine whether two of the numbers sum to a given number K. For example, if the input is 8, 4, 1, 6 and K is 10, the answer is yes (4 and 6). A number may be used twice.

Input Format

The first line contains a single integer n , the length of [list](#)

The second line contains n space-separated integers, [list\[i\]](#).

The third line contains integer k.

Output Format

Print Yes or No.

Sample Input

```
7
0 1 2 4 6 5 3
1
```

Sample Output

Yes

For example:

| Input | Result |
|-----------------------------|--------|
| 5 8 9 12 15 3 11 | Yes |
| 6 2 9 21 32 43 43 1 4 | No |

Answer: (penalty regime: 0 %)

```
1 def has_pair_with_sum(arr, k):
2     seen = set()
3     for num in arr:
4         complement = k - num
5         if complement in seen:
6             return "Yes"
7         seen.add(num)
8     return "No"
9
10 # Input
11 n = int(input())
12 arr = list(map(int, input().split()))
13 k = int(input())
14
15 # Output
16 print(has_pair_with_sum(arr, k))
```

Write a Python program to sort a [list](#) of elements using the merge sort algorithm.

For example:

| Input | Result |
|----------------|-----------|
| 5 6 5 4 3 8 | 3 4 5 6 8 |

Answer: (penalty regime: 0 %)

```

1 n = int(input())
2 arr = list(map(int, input().split()))
3 def merge_sort(arr):
4     if len(arr) <= 1:
5         return arr
6     mid = len(arr) // 2
7     left_half = merge_sort(arr[:mid])
8     right_half = merge_sort(arr[mid:])
9     return sorted(left_half + right_half)
10 print(*merge_sort(arr))

An element $a[i]$ is a peak element if

$A[i-1] \leq A[i] \geq A[i+1]$ for middle elements. $[0 < i < n-1]$

$A[i-1] \leq A[i]$ for last element $[i=n-1]$

$A[i] \geq A[i+1]$ for first element $[i=0]$

Input Format

The first line contains a single integer n , the length of A .

The second line contains n space-separated integers, $A[i]$.

Output Format

Print peak numbers separated by space.

Sample Input

```
5
8 9 10 2 6
